KeyMACRO is a small program developed in Java that helps you to edit Mac OS X keyboard shortcuts. It is not required to have any technical knowledge in order to use it, making it a highly convenient application to users who do not have the skill to set up keyboards shortcuts. You will find information about all the available Mac OS X keyboard shortcuts and the associated keystrokes, if you know what you are looking for. For example, you can change the hotkey used to activate the Super key, or you can configure a shortcut to execute a specific application, such as Safari, Mail or your browser. KeyMACRO also features a collection of a selection of keyboards, so that you can find out which keystrokes are bound to various functions, as well as to what keyboard type. In order to set up the keyboard shortcuts, the software will need to search your Mac OS X system for the file `/etc/rc.local`, which is a text file that Mac OS X automatically runs at the startup of the system. Once the file is found, you will be able to configure the shortcuts. The file can be modified with any text editor, since it is written in the UNIX shell script language. In addition, you will be able to apply changes, add new shortcuts or delete the ones that do not suit your personal preferences. KEYMACRO can be used to make changes to any file that contains the keys that make up the shortcut, so that users can activate them when they need. If you are a Mac OS X power user, KeyMACRO will be a useful utility for you, since it helps you to configure the keyboard shortcuts with ease and without the need to understand the underlying technical details.
